(54) Title: A SYSTEM, METHOD AND ARTICLE OF MANUFACTURE FOR A GROUPED PROFILE NETWORK INTERFACE

(57) Abstract

A system is disclosed that facilitates a web-based data model to support user information capture and storage is created by obtaining user profile information, grouping the user profile information in a logical manner, associating a unique name with the grouped user profile information, and storing the grouped user profile information and correlated name in a database. Access to the profile information is restricted and a customized user interface is created for each application based on the current grouped user profile information.

PCT/US99/27218

A SYSTEM, METHOD AND ARTICLE OF MANUFACTURE FOR A GROUPED PROFILE NETWORK INTERFACE

Fleld Of The Invention

The present invention relates to agent based systems and more particularly to an agent based system for providing a user interface that teatitates turing of the user experience to the personal intentions of a particular user profile selected from a group of user profiles.

Agent based technology has become increasingly important for use with applications designed to interact with a user for performing various computer based tasks in foreground and background modes. Agent software comprises computer programs that are set on behalf of users to perform routine, tedious and time-consuming tasks. To be useful to an individual user, an agent must be personalized to the individual user's goals, habits and preferences. Thus, there exists a substantial requirement for the agent to efficiently and effectively acquire user-specific knowledge from the user and utilize it to perform tasks on behalf of the user.

2

2

The concept of agency, or the user of agents, is well established. An agent is a parson authorized by another parson, typically referred to as a principal, to act on behalf of the principal. In this manner the principal empowers the agent to perform any of the relative that principal is unwilling or unable to perform. For example, an insurance agent may handle all of the insurance requirements for a principal, or a takent agent may act on behalf of a performate to arrange concert dates.

With the advent of the computer, a new domain for employing agents has arrived. Significant advances in the realin of expert systems enable computer programs to act on behalf of computer users to perform routine, bedious and other time-consuming asks. These computer programs are referred to as software agents.

20

23

Moreover, there has been a recent profestation of computer and communication networks. These networks permit a user to access vest amounts of information and services without essentially, any geographical boundaries. Thus, a software agent has a rich environment to perform a large number of tasks on behalf of a user. For example, it is now possible for an agent to make an airline reservation, purchase the faciet, and have the tokal delivered directly to a user. Similarly, an agent could scan the Internet and obtain information ranging from the lattest sports or nevs to a particular graduate thesis in applied physics. Current solutions tall to apply agent technology to existing calendar bechanged by provide targeted acquisition of background information for a user's upcorning events.

8

SUMMARY OF THE INVENTION

According to a broad expect of a preferred embodiment of the invention, a date model to support user information capture and storage is created by obtaining user profile information, grouping the user profile information, and storing the grouped user profile information, and storing the grouped user profile information, and storing the grouped user profile information is restricted and a customized user interface is created for each application based on the current grouped user profile information.

DETAILED DESCRIPTION

A preferred embodiment of a system in accordance with the prevent invention is preferably practiced in the context of a personal computer such as an IBM compatible personal computer. Apple Macintosh computer or UNIX based workstation. A

other units interconnected via a system bus 112. The workstation shown in Figure 1 includes a Random Access Memory (RAM) workstation to a communication network (e.g., a data processing network) and a display adapter 136 for connecting the bus 112 114. Read Only Memory (ROM) 116, an I/O adapter 118 for connecting peripheral devices such as disk storage units 120 to the or Windows/95 Operating System (OS), the IBM OSZ operating system, the MAC OS, or UNIX operating system. Those skilled to a display device 138. The workstallon typically has resident thereon an operating system such as the Microsoft Windows NT other user interface devices such as a touch screen (not shown) to the bus 112, communication adapter 134 for connecting the representative hardware environment is depicted in Figure 1, which litustrates a typical hardware configuration of a workstation in accordance with a preferred embodiment having a central processing unit 110, such as a microprocessor, and a number of bus 112, a user interface adapter 122 for connecting a keyboard 124, a mouse 126, a speaker 128, a microphone 132, endlor in the art will appreciate that the present invention may also be implemented on platforms and operating systems other than 2 33 23

those mentioned.

WO 00/31664

PCT/US99/27218

Object oriented programming (OOP) has become increasingly used to denatop complex applications. As OOP moves toward the A preferred embodiment is written using JAVA, C. and the C++ language and utilizas object oriented programming methodology. OOP. A need exists for these principles of OOP to be applied to a messaging interface of an electronic messaging system such mainstream of software design and development, various software solutions require adaptation to make use of the bornofits of that a set of OOP classes and objects for the messaging interface can be provided.

Š

self-sufficient component that does not require other additional structures, procedures or data to perform its specific task. OOP, structures and procedures. Since it contains both data and a collection of structures and procedures, it can be visualized as a OOP is a process of developing computer so have using objects, including the steps of analyzing the problem, designing the system, and constructing the program. An object is a software package that contains both data and a collection of related responsible for a specific task. This concept of packaging data, structures, and procedures together in one component or therefore, views a computer program as a collection of targely autonomous components, called objects, each of which is module is called encapsulation.

2

which are accessed at run-time through a component integration architecture. A component integration architecture is a set of In general, OOP components are reusable software modules which present an interface that conforms to an object model and architecture mechanisms which allow software modules in different process spaces to utilize each others capabilities or functions. This is generally done by assuming a common component object model on which to build the architecture

2

It is worthwhite to differentiate between an object and a class of objects at this point. An object is a single instance of the class of objects, which is often just called a class. A class of objects can be viewed as a blueprint, from which many objects can be

2

OOP allows the programmer to create an object that is a part of another object. For example, the object representing a pixton engine is said to have a composition-relationship with the Object representing a piston. In reality, a piston engino comprises a piston, valves and many other components; the fact that a piston is an element of a piston engine can be logically and semantically represented in OOP by two objects. 52

engine and the other representing a piston angine wherein the piston is made of caramic, then the relationship between the two representing the caramic piston engine is called a derived object, and it Inharits all of the aspects of the object representing the objects is not that of composition. A ceramic piston engine does not make up a piston engine. Rather it is merely one kind of piston engine and adds further limitation or detall to it. The object representing the ceramic piston engine "depends from" the OOP also allows creation of an object that "depends from" enother object. If there are two objects, one representing a piston piston engine that has one more limitation than the piston engine; its piston is made of ceramic. In this case, the object object representing the piston engine. The relationship between these objects is called inheritance.

35

8

When the object or class representing the coramic piston engine inherits all of the aspects of the objects representing the piston piston engine object overrides these ceramic specific thermal characteristics, which are typically different from those associated engine, it inherits the thermal characteristics of a standard piston defined in the piston engine class. However, the ceramic

WD 00/31664

.

PCT/US99/27218

with a metal piston. If skips over the original and uses new functions related to ceranic pistons. Different kinds of piston engines have different characteristics, but may have the same underlying functions associated with it (e.g., how many pistons in the engine, ignition sequences, lubrication, etc.). To access each of these functions in any piston engine object, a programmer would call the same functions with the same names, but each type of piston engine may have different/overriding implementations of functions behind the same name. This ability to hide different implementations of a function behind the same name. This ability to hide different implementations of a function behind the same name is called polymorphism and it greatly simplifies communication among objects.

Š

With the concepts of composition-relationship, encapsulation, inheritance and polymorphism, an object can represent just about amyting in the real word. In fact, our logical perception of the reality is the only limit on determining the kinds of things that can become objects in object outened software. Some typical categories are as follows:

2

- Objects can represent physical objects, such as automobiles in a traffic-flow simulation, electrical components in a circuit-dasign program, countries is an economics model, or ait cart in an air-traffic-control system.
- Objects can represent elements of the computar-user environment such as windows, menus or graphics objects.
- An object can represent an inventory, such as a personnel file or a table of the fatitudes and longitudes of cities.
- 15 An object can represent user-defined data types such as time, angles, and complex numbers, or points on the plane.

With this enormous capability of an object to represent just about any logically separable matters, OOP allows he software developer to design and implement a compuler program that is a model of some aspects of reality, whether that reality is a physical entity, a process, a system, or a composition of mailer. Since the object can represent anything, the software developes can create an object which can be used as a component in a larger software project in the future.

ន

If 90% dia new OOP sothware program consists of proven, existing components made from preexisting reutable objects, then only the remaining 10% of the new software project has to be written and tested from scratch. Since 80% already came from an inventory of extensively tested reusable objects, the potential domain from which an error could originate is 10% of the program. As a result, OOP enablos software developers to build objects out of other, previously built objects.

25

This process dosely resembles complex madhinery being built out of assembles and sub-assembles. OOP lechnology, therefore, makes software engineering more like hardware engineering in that software is built from existing components, which are available to the developer as objects. All this adds up to an improved quality of the software as well as an increased speed of its development.

8

Programming languages are beginning to fully support the OOP principles, such as encapsulation, inheritance, polymorphism, and composition-relationatip. With the advent of the C++ language, many commercial software developers have embraced OOP. C++ is an OOP language that offers a fast, machine-executable code. Furthermore, C++ is suitable for both commercial application and systems-programming projects. For now, C++ appears to be the most popular choice among many OOP programmers, but there is a host of other OOP languages, such as Smalltaik, common isp object system (CLOS), and Eiffiel Additionally, OOP capabilities are being added to more traditional popular computer programming languages such as Peacal.

33

WO 00/31664

PCT/US99/27218

The benefits of object classes can be summarized, as follows:

- Objects and their corresponding classes break down complex programming problems into many smaller, simpler problems.
- Encapsulation enforces data abstraction brough the organization of data into small, independent objects that can
 communicate with each other. Excapsulation protects the data in an object from accidental damage, but allows other
 objects to internal with that data by railing the object's member functions and structures.
- Subclessing and shallance make it possible to extend and modify objects through deriving new kinds of objects from the standard classes are aliable in the system. Thus, new capabilities are created without having to start from scratch.
- Pelymorphism and multiple inheritance make it possible for different programmers to mix and march characteristics of many different classes and create specialized objects that can still work with related objects in predictable ways.

2

- Class herarches and containment hierarchies provide a fe-tible mechanism for modeling real-world objects and the relationships among them.
 - Libraries of reusable classes are useful in many situations, but they also have some limitations. For example:
- Complexify. In a complex system, the dass hierarchies for related dasses can become extremely confusing, with many dozzars or even hundreds of desses.

2

- Flow of control. A program written with the aid of class ibraries is still responsible for the flow of control (i.e., it must control the interactions among all the objects created from a particular library). The programmer has to decide which functions to call at what times for which tands of objects.
- Duptication of effort. Although class thrates allow programmers to use and reuse many small piccoss of code, each
 programmer puts those pieces together in a different way. Two different programmers can use the same set of class
 libraries to write two programs that do exactly the same bring but whose internal structure (i.e., design) may be quite
 different, depending on hundreds of small decisions each programmer makes along the way, then/laby, similar pieces
 of code end up doing similar things in stightly different ways and do not work as well together as they should.

20

25

ဓ္က

Class librarios are very faulble. As programs grow more complex, more programmers are farrood to reinvent basic solutions to basic problems over and over again. A relatively new extension of the dass librarios, or lative is to have a framework of dass librarios. This framework is more complex and consists of significant cellections of collaborating dasses that capture both the small scale patterns and major mechanisms that implement the common requirements and steagin in a specific application domain. They were first developed to free application programmers from the chores involved in displaying menus, windows, dialog boxes, and other standard user interface elements for parsonal computers.

Frameworks also represent a change in the way programmer; think about the interaction between the code they write and code written by others. In the early days of procedural programming, the programmer called libraries provided by the operating system to perform certain tasks, but basically the program executed down the page from start to finish, and the programmer was solely responsible for the flow of control. This was appropriate for printing out psychecits, calculating a mathematical table, or solving other problems with a program that executed in just one way.

ф

PCT/US99/27218

The development of graphical user interfaces began to turn this procedural programming arrangement inside out. These interfaces allow the user, rather than program look the program and decide when certain actions should be performed. Today, most personal computer software accomplishes this by means of an event loop which monitors the mouse, keyboard, and other sources of external events software accomplishes this by means of an event loop which monitors the mouse, keyboard, and other sources of external events and calls the appropriate parts of the programmer's code accounting to actions that the user performs. The programmer no longer determines the order in which events occur. Instead, a program is divided into separate beside creates a program written by the developed adversarial process and the programmer must still determine the flow of control within each piece after being called by the event loop. Application code still "sits on top of" the system.

s

2

Even event boop programs require programmers to write a lot of code that should not need to be written separately for every application. The concept of an application framework carties the event loop concept further. Instead of dealing with all the nuits and boils of constructing basic menus, windows, and dialog boxes and then making tress things all work lopether, programmers using application frameworks start with working application code and basic user interface elements in place. Subsequently, they built from there by replacing some of the generic capabilities of the framework with the specific capabilities of the intended

2

Application framsworks reduce the total emount of code that a programmer has to write from scratch. However, because the framework is really a generic application that displays windows, supports copy and paste, and so on, the programmer can also relinquish control to a greater degree than event loop programs permit. The framework code takes care of almost all event handling and flow of control, and the programmer's code is called only when the framework needs it (e.g., to create or manipulate a proprietary data structure).

2

A programmer writing a framework program not only relinquisnes control to the user (as is also true for event loop programs).

but also relinquishes the detailed flow of control within the program to the framework. This approach allows the creation of more complex systems that work together in interesting ways, as opposed to isolated programs, having custom code, being created over and over again for similar problems.

25

Thus, as is explained above, a framework basically is a collection of cooperating dasses that make up a reusable design solution for a given problem domain. It typically includes objects that provide default behavior (e.g., for menus and windows), and programmers use it by inheriting some of that default behavior and overntling other behavior so that the framework calls application code at the appropriate times.

2

There are three main differences between frameworks and class libraries:

33

Behavior versus protocol. Class libraries are essentially collections of behaviors that you can call whon you want those individual behaviors in your program. A framework, on the other hand, provides not only behavior but also the proboot or set of rudes that govern the ways in which behaviors can be combleted, including rules for what a programme is supposed to provide versus what the framework provides.

WO 00/31664

PCT/US99/27218

Call versus override. With a class library, the code the programmer instantiates objects and calls their member
functions. It's possible to instantiate and call objects in the same way with a framework (i.e., to breat the framework is
a class library), but to take full advertage of a framework's reusable dissign, a programmer typically writes code that
overrides and is called by the framework. The framework manages the flow of control among its objects. Writing a
program involves dividing responsibilities among the various pieces of software that are called by the framework rather
than specifying how the different pieces should work together.

S

Implementation versus design. With class libraries, programmers reuse only implementations, whereas with frameworks, they reuse design. A framework embodies the way a family of related programs or pieces of estivate work. It represents a genetic design solution that can be adapted to a variety of specific problems in a given domein. For example, a single framework can embody the way a user interface works, even though two different user.

interfaces created with the same framework might solve quite different interface problems.

2

2

Thus, through the development of frameworks for solutions to various problems and programming tasks, significant reductions in

the design and development affort for software can be achieved. A preferred embodiment of the invention utilizes HyperTead Markup Language (HTML) to implement documents on the internet together with a generat-purpose secure communication protocol for a transport medium between the client and the Newco. HTTP or other protocols could be readily substituted for HTML without undue soprementation. Information on these products is available in T. Bernort-Lea, D. Cornory, TRFC 1866: Hypertext Markup Language - 2.0° (Nov. 1995); and R. Fadding, H. Fryshy, T. Bernort-Lea, J. Centry, TRFC 1866: Hypertext documents are protocid from one platform (or another. HTML documents are SGML documents are forced to create hypertext documents that are portable from one platform (or another. HTML documents are SGML documents with generic semantics that are appropriate for representing information from a wide range of domains. HTML has been in use by the Word-Wide Web gobel information infants as no 1990. HTML is an apprecation of ISO Standard 8879:1886 information Processing Text and Office Systems: Standard Generalized Markup Language (SGML).

2

To date, Web development tods have been familed in their solliny to create dynamic Web applications which span from client to server and interoperate with existing computing resources. Until recently, HTML has been the dominant technology used in development of Web-based solutions. However, HTML has proven to be inadequate in the following areas:

25

Poor performance;

Restricted user interface capabilities;

Can only produce static Web pages;

8

Lack of interoperability with existing applications and data; and

Inability to scale.

Sun Microsystem's Java language solves many of the client-side problems by:

improving performance on the client side;

33

employing perioring occupies again agos.

Enabling the creation of dynamic, real-time Web applications; and

Providing the ability to create a wide variety of user interface components.

PCT/US99/27218

animated toons, etc.) can be created, and client-side performance is improved. Unlike HTML, Java supports the notion of clientside validation, officading appropriate processing onto the client for improved performance. Dynamic, real-time Web pages can With Java, davelopers can create robust User Interface (UI) components. Custom "widgets" (e.g. real-time stock tickers, be created. Using the above-mentioned custom UI components, dynamic Web pages can also be created. Sun's Jara language has emerged as an industry-recognized language for "programming the Internet." Sun defines Java as: "a trom the server to client. From a language standpoint, Java's core feature set is based on C++. Sun's Jave titerature states that dynamic, buzzword-compliant, general-purpose programming language. Java supports programming for the Internet in the form of platform-independent Java applets." Java applets are small, specialized applications that comply with Sun's Java Application simple, object-crientad, distributed, Interpretad, robust, secure, architecture-neutral, portable, high-performance, multithreaded, adomments, basic games, etc.). Applets execute within a Java-compatible browser (e.g. Netscape Navigator) by copying code Programming Interface (API) allowing developers to add "interactive content" to Web documents (e.g. simple animations, page Java is basically "C++, with extensions from Objective C for more dynamic method resolution".

2

~

Anothor technology that provides similar function to JAVA is provided by Marcsoft and ActiveX Technologies, to give developers and frame, Microsoffs development tool for Java, code named "Jakarta". ActiveX Technologies also includes ActiveX Server Framework, animation, 3-D virtual reality, video and other multimedia content. The tools use Internet standards, work on multiple padrorms, and enable developers to embed parts of software in hypartext markup language (HTML) pages. ActiveX Controls work with a variety of allowing developers to create server applications. One of ordinary skill in the art readuly recognizes that ActiveX could be substituted Web designers wherewithal to build dynamic content for the Internet and personal computers. ActiveX includes tools for developing are being supported by over 100 companies. The group's building blocks are called ActiveX Controls, small, fast components that programming languages including Microsoft Visual C↔, Bortand Detphi, Microsoft Visual Basic programming system and, in the for JAVA without undue experimentation to practice the invention.

2

Netscape" and "Microsoff" and the topic is "disputos." Then, the system queries the web for relevant information concerning the For example, if an individual has a meeting with Netscape and Microsoft to talk about their disputas, and would obtain this Initial individual for an upcoming meeting by helping himher retrieve relevant information about the meeting from various sources. BF receives input text in character form indicative of the larget meeting. The input text is generated in accordance with a preferred embodiment by a catendar program that includes the time of the meeting. As the time of the meeting approaches, the calendar also performs patham matching to identify particular meeting fields in a meeting taxl. This information is utilized to query various sources of information on the web and obtain relevant stories about the current meeting to send back to the calendaring system. In accordance with a preferred embodiment, BackgroundFinder (BF) is implemented as an agent responsible for preparing an program is queried to obtain the text of the target event and that information is utilized as input to the agent. Then, the agent parses the input meeting text to extract its various components such as title, body, participants, location, time etc. The system topic. Thus, in accordance with an objective of the invention, the system updates the calendaring system and eventually the information from the calendaring system. It will then parse out the text to realize that the companies in the meeting are embodiment, the information is stored in a file that is obtained via estection from a link imbedded in the calendar system. user with the best information it can gather to prepare the user for the target meeting. In accordance with a preferred 35 23 2

WO 00/31664

PCT/US99/27218

PROGRAM ORGANIZATION

only for debugging purposes. The executable programs in accordance with a preferred embodiment never execute with the user nterface and should only return to the calendaring system through Microsoft's Winsock control. A preferred embodiment of the Background Finder, Error, BF. PattamMatching and BF. Search. There is also a frmMain which provides a user interface used system executes in two different modes which can be specified under the command tine sent to it by the calondaring system. When the system runs in simple mode, it executes a keyword quary to submit to external search engines. When executed in A computer program in accordance with a preferred embodiment is organized in five distinct modulesr. BF.Main, BF.Parse, complex mode, the system performs pattern matching before it forms a query to be sent to a search engine.

S

DATA STRUCTURES

2

The system in accordance with a preferred embodiment utilizes three user defined structures:

- 1. TMeetingRecord;
- TPatternElement; and
- TPattemRecord.

important to note that only one meeting record is created per instance of the system in accordance with a preferred embodiment. includes useriD, an original description of the meeting, the extracted list of keywords from the title and body of meeting etc. It is The user-defined structure, MeetingRecord, is used to store all the pertinent information concerning a single meeting. This info tor only one meeting. Therefore, the mesting record created corresponds to the current meeting examined. ParseMeetingText This is because each time the system is spawned to service an upcoming meeting, it is assigned a task to retrieve information updated. The structure of !MeetingRecord with each field described in parentheses is provided below in accordance with a if CoPatternMatch can bind any values to a particular meeting field, the corresponding entries in the meeting record is also populates this meeting record and it is then passed around to provide information about the meeting to other functions. preferred embodiment. 2 15

(original non stop listed title we need to keep around to send back to Munin) Public Type (MeetingRecord (sloplisted title with only keywords) (user id given by Munin) eTitleOrig As String STilleKW As String sUserID As String A.1,1,1,1 25

2

End Type

COMMON USER DEFINED CONSTANTS

Many constants are defined in each declaration section of the program which may need to be updated periodically as part of the process of maintaining the system in accordance with a preferred embodiment. The constants are accessible to allow dynamic configuration of the system to occur as updates for maintaining the code.

20

Included in the following tables are lasts of constants from each module which I thought are most likely to be modified from time to time. However, there are also other constants used in the code not included in the following Ist. It does not mean that these non-included constants will never be changed. It means that they will change much less frequently.

For the Main Module (BF.Main):

35

MSGTOMUNIN_TYPE 6 Define the massage number used to identify massages number used to identify massages between 8F and Munin iP_ADDRESS_MUNIN 110.2.100.48" Define the IP address of the machine in which Munin and BF are numing on so they can transfer data

PORT_MUNIN 7777 Define the remain part in which we are operating on.

TAMEOUT_AV 60 Define constants for selling time out in het controls TAMEOUT_NP 60 Define constants for selling time out in het controls

÷

WO 00/31664

PCT/US99/27218

CONSTANT	PRESET VALUE	USE
CMD_SEPARATOR	, ,	Define delimiter to tell which part of Murtin's command
		represents the beginning of our input meeting taxt
OUTPARAM_SEPARATOR		Define delimiter for separating out different portions of
		the output. The separator is for delimiting the mag
		type, the user id, the meeting title and the beginning
		of the actual stories retrieved.

For the Search Module (BF. Search):

THE SERVICE SERVICES (ST. SERVICE).			
CONSTANT	CURRENT VALUE	USE	
PAST_NDAYS	2	Define number of days you want to took back for	
		AlaVista articles. Doesn't really matter now because	
		we aren't really doing a news search in alla vista. We	
		want all info.	
CONNECTOR_AV_URL	*AND*	Define how to connect keywords. We want all our	_
		keywords in the string so for now use AND. If you	
		want to do an OR or something, just change	_
		солпеског.	
CONNECTOR_NP_URL	.+AND+	Define how to connect keywords. We want all our	_
		keywords in the string so for now use AND. If you	
		want to do an OR or something, just change	
		connector.	
NUM_NP_STORIES	3	Define the number of stories to return back to Munin	_
		from NewsPage.	
NUM_AV_STORIES		Define the number of stories to return back to Munin	_
		from AttaVista.	

For the Parse Modute (8F.Parse):

CONSTANT	CURRENT VALUE	USE
PORTION_SEPARATOR		Define the separator between different portions of the
		meeting text sent in by Munin. For example in
		09::Meet with Chad::about life::Chad Denise:::::
		":" is the separator between different parts of the
		meeting text.

-15

PCT/US99/27218

CONSTANT	CURRENT VALUE USE	USE
PARTICIPANT_SEPARATOR	L	Define the separator between each participant in the
		participant list portion of the original meeting text.
		Refer to example above.

For Patham Matching Module (BFPatternMatch): There are no constants in this module which require frequent updates.

General Process Flow

2

The best way to depict the process flow and the coordination of functions between each other is with the five flowchatts illustrated in Figures 2 to 6. Figure 2 depicts the overall process flow in accordance with a preferred embodiment. Processing commences at the bot of the chart at function block 200 which launches when the program starts. Once the application is started, the command line is parsed to remove the appropriate meeting test to initiate the target of the background find operation in accordance with a preferred embodiment as shown in function block 210. A global stop list is generated after the target is determined as shown in function block 220. Then, by tracting broady the chart, function block 200 involves GoBF 240 which is responsible for beglotal processing associated with wrapping the correct search query information for the particular target search engine. For example, function block 240 flows to function block 250 and it then calls GoPatternMatch as shown in function block 280. To see the process flow of GoPatternMatch, we swap to the diagram filled "Process Flow for BF's Pattern Matching Unit."

0

2

One key thing to notice is that functions depicted at the same level of the chart are called by in sequential order from left to right (or top to bettern) by their common parent function. For example, Main 200 cats ProcessCommandLine 210, then CreateStopListist 220, then CreateStopListist 220, then CreatePatterns 220, then GobactgroundFinder 240. Figures 3 to 6 detail the logic for the entire program, the parsing unit, the petitem matching unit and the search unit respectively. Figure 6 details the logic determinative of data flow of key information through BackgroundFinder, and shows the functions that are responsible for creating or processing

2

DETAILED SEARCH ARCHITECTURE UNDER THE SIMPLE QUERY MODE

SEARCH ALTA VISTA

52

(Function block 270 of Figure 2)

The Alta Vista search engine utitizes the identifies and returns general information about topics related to the current meeting as shown in function book 270 of Figure 2. The system is eccordance with a preferred embodiment takes all the keywords from the title protion of the original meeting text and constructs an advanced query to send to Alta Vista. The keywords are logically combined together in the query. The results are also ranked based on the same set of keywords. One of ordinary skill is the art will readily comprehend that a date restriction or publisher criteria could be facilitated on the articles we want to retrieve. A set of top rentaining stories are returned to the calendaring system in accordance with a preferred embodiment.

8

÷

WO 00/31664

PCT/US99/27218

NEWS PAGE (Function block 275 of Figure 2)

The NewsPage search system is responsible for giving us the latest news topics related to a target meeting. The system takes all of the keywords from the tide portion of the original meeting text and constructs a query to send to the NewsPage search engine. The keywords are kopically combined together in the query. Only articles published recently are restieved. The Newspage search system provides a date restriction criteria that is settable by a user according to the user's preference. The top making stories are returned to the catendaring system.

Figure 31s a user profile data model in accordance with a praterned embodiment. Processing commences at function block 300 which is responsible for invoking the program from the main module. Then, at function block 310, a wrapper function is invoked to present the seyword as a carbonal and a second as a bundant of the number of words in function block 330 the determines for the particular field are and a particular field from the meeting taxt is retrieved a particular strip is excluded and the detirmiers for the particular field are and a particular field from the meeting taxt is retrieved appropriately. Finally, at function block 380, the detirmiers of the string are again checked to assure they are placed appropriately. Finally, at function block 380, the extraction of earl word from the title and body of the message is porformed a word as a time utilizing the bogic in function block 382 which finds the next closest word definities if a word is not phrase, function block 384 which inthis unnecessary materials from a word and function block 388 which definities if a word is on the stop list and returns an error if the word is on the stop list.

3

2

PATTERN MATCHING IN ACCORDANCE WITH A PREFERRED EMBODIMENT

The limitations associated with a simple searching method include the following:

Because it reles on a stopist of unwanted words in order to extract from the meeting text a set of keywords, it is
limited by how comprehensive the stopist is. Instead of trying to figure cut what paris of the meeting text we should
throw away, we should focus on what paris of the meeting text we want.

53

A simple search method in accordance with a preferred embodiment only uses the keywords from a meeting title to
form queries to send to Alla Vista and NewsPage. This ignores an attenuative source of information for the query, the
body of the meeting notice. We cannot include the keywords from the meeting body to from our queries because this
often results in queries which are too long and so complex that we otten obtain no meaningful results.

20

- 3. There is no way for us to lest what each keyword represents. For example, we may extract 'Andy' and 'Grove' as two keywords. However, a simplistic search has no way knowing that "Andy Grove' is in fact a person's name. Imagino the possibilities if we could accordiow intelligently guess that "Andy Grove' is a person's name. We can find out if he is an Andersen person and if so what kind of projects ha's boen on before etc. etc.
 - 4. In summary, by relying solely on a stoplist to parse out unnecessary words, we suffer from "information overload".

35

<u>÷</u>

PCT/US99/27218 WO 00/31664 PATTERN MATCHING OVERCOMES THESE LIMITATIONS IN ACCORDANCE WITH A PREFERRED EMBODIMENT

Here's how the pattern matching system can address each of the corresponding issues above in accordance with a preferred

S

- 1. By doing pattern matching, we match up only parts of the meeting text that we want and extract those parts.
- By performing pattern matching on the meeting body and extracting only the parts from the meeting body that we want. Our meeting body will not go to complete waste then.
- Pattern matching is based on a set of templates that we specify, allowing us to identify people names, company names etc

2

our pattern matching works. If we rely exclusively on artificial intelligence processing, we do not have a 100% hit rate. We In summary, with pettern matching, we no longer suffer from information overload. Of course, the big problem is how well are able to identify about 20% of all company names presented to us.

PATTERNS

2

be something like the word "with" followed by a person's name (in this example it is Bob Dutton) followed by the word "from" and would write something such as "Meet with Bob Dufton from Stanford University next Tuesday." A continon pattern would then meeting text. The patterns supported by a preferred embodiment are selected because they are templates of phrases which have a high probability of appearing in someone's meeting taxl. For example, when entering a meeting in a calandar, many A partam in the context of a preferred embodiment is a temptate specifying the structure of a phrase we are booking for in a ending with an organization's name (in this case, it is Stanford University).

2

PATTERN MATCHING TERMINOLOGY

The common terminology associated with pattern matching is provided below

55

- Pattern: a pattern is a template specifying the structure of a phrase we want to bind the meeting text to. It contains sub
- a pattern can contain many sub-units. These subunits are called elements. For example, in the pattern with SPEOPLES from \$COMPANYS; with "SPEOPLES" from "\$COMPANYS" are all elements. Element: 8
- Paceholder: a piaceholder is a special kind of element in which we want to bind a value to. Using the above example, *PEOPLES" is a placeholder.
- indicator: an indicator is another kind of element which we want to find in a meeting text but no vake needs to bind to it. There may be often more than one indicator we are looking for in a certain pattern. That is why an indicator is not an "atomic" type. 32
- Substitute: substitutes are a set of indicators which are all synonyms of each other. Finding any one of them in the input is

÷

7/28/2006, EAST Version: 2.0.3.0

WO 00/31664

PCT/US99/27218

There are five fields which are identified for each meeting:

- (SCOMPANYS) Company
 - (SPEOPLES)

(\$LOCATIONS)

Location

Š

- (\$TIMES) Ë
- (\$10PIC_UPPER\$) or (\$TOPIC_AUL\$)

in parentheses are the placeholders I used in my code as representation of the corresponding meeting fields.

Each placeholder has the following meaning:

2

- \$COMPANYS: binds a string of capitalized words (e.g. Meet with Joe Carter of <Andersen Consulting >)
- SPEOPLES: binds series of string of two capitalized words potentially connected by "," and or '6" (e.g. Meet with

 Loc Carter> of Anderson Consulting, Meet with

 Loc Carter and Luke Hughes> of Anderson Consulting)
- \$LOCATION\$: binds a string of capitalized words (e.g. Meet Susan at <Polo Alto Square>)
- \$TIME\$: binds a string containing the format #:## (e.g. Dinner at <6:30 pm>)

- \$TOPIC_UPPER\$: binds a string of capitalized words for our topic (a.g. <Stanford Engineering Recruiting> Meeting to talk about new hires).
- \$TOPIC_ALL\$: binds a string of words without really caring if it's capitalized or not. (e.g. Meet to talk about cubiquitous computings)
- Note that the patients which are grayed out are also commented in the code. BF has the capability to support these patients but Here is a table representing all the patterns supported by BF. Each pattern belongs to a pattern group. All patterns within a pattern group share a similar formal and they only differ from each other in terms of what indicators are used as substitutes. we decided that matching these patterns is not essential at this point. 20

function block 400 where the main program invokes the pattern matching application and passes control to function block 410 to Figure 4 is a detailed flowchart of pattern matching in accordance with a preferred embodiment. Processing commences at

WO 00/31664

PCT/US99/27218

pattern which includes determining if a part of the taxt string can be bound to a pattern as shown in function block 430. Then, at function block 440, various placeholders are bound to values if they exist, and in function block 441, a fist of namos separated by grabbing the next letter efter a space after a word to determine if it is capitalized. Then, at function block 443, lime is pareed out word sitter the blank is obtained for further processing in eccordance with a preferred embodiment. Following the match meeting next word after unnecessary write space such as that following a line feed or a carriage return is processed as shown in function block 462 and the word is analyzed to determine if it is an indicator as shown in function block 464. Then, in function block 470, is obtained as shown in function block 452 and the word is checked to determine if the word is an indicator as shown in function block 454. Then, at function block 460, the string is parsed to locate an indicator which is not at the end of the pattern and the record is updated and at function block 482 a check is performed to determine if an entry is already made to the meeting record of the string in an appropriate manner and the next word after a blank space in function block 444. Then, at function block 445, field processing, function block 450 is utilized to loacte an indicator which is the head of a pattern, the next word efter the blank the continuous phreses of capitalized words such as company, topic or tocation are bound and in function block 446, the next punctuation are bound, and at function block 442 a full name is processed by finding two capitalized words as a full name and the temporary record is reset to the null set to prepare it for processing the next string and at function block 480, the meeting commence the pattern match processing. Then, at function block 420, the wrapper function loops through to process each before parsing the meeting record again.

2

2

USING THE IDENTIFIED MEETING FIELDS

section is to give the reader a good sense of how the results obtained from pattern matching can be used to help us obtain better the results of pattern matching that we can add to BF. These other options will be described in the next section. The goal of this Now that we have identified fields within the meeting taxt which we consider important, there are quite a few things we can do eventually gets submitted to Alta Vista and News Page. There are also a lot of other options and enhancements which expirit with it. One of the most important epplacations of pattern matching is of course to improve the query we construct which search results.

2

23

Figure 5 is a flowchart of the detailed processing for preparing a query and obtaining information from the internet in eccordance Alta Vista search engine, then at function block 530, the system takes information from the meeting record and forms a query in process the wrapper functionality to prepare for an internet search utilizing a web search engine. If the search is to utilize the function blocks \$40 to \$60 for submittal to the search engine. If the search is to utilize the NewsPage search engine, then of with a preferred embediment. Processing commences at function block 500 and immediately flows to function block 510 to lunction block \$20, the system takes information from the meeting record and forms a query in function blocks \$21 to \$28.

3

Alta Vista Search Engine

construct all sorts of Bodean queries and rank the search however you want. However, one of the biggest drawbacks with Ala The strength of the Alia Vista search engine is that it provides enhanced flexibility. Using its advance query method, one cen Vista is that it is not very good at handling a large query and is likely to give back irrelevant results. If we can identify the topic results. We also want to focus on the topics found. It may not be of much ment to the user to find out into about a company and the company within a meeting text, we can form a pretty short but comprehensive query which will hopefully yield better

PCT/US99/27218

especially if the user aiready knows the company wed and has had numerous meetings with them. It's the topics they want to

News Page Search Engine

The strength of the News Page search engine is that it does a great job searching for the most recent news if you are able to give it a valid company name. Therefore when we stubmit a query to the news page web site, we send whatever company name we can identify and only if we cannot find one do we use the topics found to form a query. If neither one is found, then no search is performed. The algorithmn utilized to form the query to sudmit to Alta Vista is illustrated in Figure 7. The algorithmn that we will use to form the query to submit to News Page is itostrated in Figure 8.

appear mimics the process flow as closely as possible. When there are situations in which a function is called several times, this The following table describes in detail each function in eccordance with a preferred embodiment. The order in which functions function will be listed after the first function which calls it and its description is not duplicated after every subsequent function

2

Procedure Name	Type	Called By	Description
	Public Sub	Nane	This is the main function where the program first
(BF.Main)			launches. It initializes BF with the appropriate
			parameters(e.g. Internet time-out, stoplist) and calls
			GoBF to launch the main part of the program.
ProcessCommand	Private Sub	Main	This function parses the command line. It assumes that
			the delimiter indicating the beginning of input from
(BF.Main)			Munin is stored in the constant CAID_SEPARATOR.
CreateStopList	Private	Main	This function sets up a stop list for future use to parse
(BF.Main)	Function		out unwanted words from the meeting lext.
			There are commas on each side of each word to enable
			straight checking.
CreatePatterns	Public Sub	Main	This procedure is called once when BF is first initialized
(BF.PatternMatch)			to create all the potential patterns that portions of the
			meeting text can bind to. A pattern can contain however
			many elements as needed. There are two types of
			elements. The first type of elements are indicators.
			These are real words which delimit the potential of a
			meeting field (eg company) to follow. Most of these
			indicators are stop words as expected because stop
			words are words usually common to all meeting faxt so
			it makes sense they form patterns. The second type of
			elements are special strings which represent
			placehodders.

÷

WO 00/31664

PCT/US99/27218

Procedure Name	lype	Called By	Description
			A piaceholder is always in the form of \$1\$ where " can
			be either PEOPLE, COMPANY, TOPIC_UPPER,
	-		TIME, LOCATION or TOPIC, ALL. A pattern can begin
			with either one of the two types of elements and can be
			however long, involving however any numberitype of
			elements. This procedure dynamically creates a new
			pattern record for each pattern in the table and it also
			dynamically creates new tAPattemElements for each
			element within a pattern. In addition, there is the
			concept of being able to substitute indicators within a
			pattern. For example, the pattern \$PEOPLE\$ of
			\$COMPANY\$ is similar to the pattern \$PEOPLE\$ from
			\$COMPANY\$. "from" is a substitute for "of". Our
			structure should be able to express such a need for
			substitution.
GoBF	Public Sub	Main	This is a wrapper procedurer that calls both the parsing
(8F.Main)			and the searching subroutines of the BF. It is also
			responsible for sending data back to Munin.
ParseMeetingText	Public	GoBackGroundFinder	This function takes the initial meeting text and identifies
(BF.Parse)	Function		the useriD of the record as well as other parts of the
			meeting text including the title, body, participant list,
			location and time. In addition, we call a helper function
			Process StopList to eliminate all the unwanted words
			from the original meeting title and meeting body so that
			only keywords are left. The information parsed out is
			stored in the MeelingRecord structure. Note that this
			function does no error checking and for the most time
			assumes that the meeting text string is correctly
			formatted by Munin. The Important variable is
			this Meeting Record is the temp holder for all info
			regarding current meating. It's eventually returned to
			caller.
FormatDelimitation	Private	ParseMeetingText,	There are 4 ways in which the delimiters can be placed.
(BF.Parse)		DetermineNumWords.	We take care of all these cases by reducing them down
		GetAWordFromString	to Case 4 in which there are no delimiters around but
			only between fields in a string(e.g. A::B::C)
DetermineNumWor	Public	ParseMeeting	This functions determines how many words there are in

PCT/US99/27218

. Mucedare Marile	adkı	Called by	Vescupion
8	Function	Text, ProcessStop	a string (stinEvalString) The function assumes that each
(BF.Parse)		5	word is separated by a designated separator as
			specified in #1Separator. The return type is an integer
			that indicates how many words have been found
			assuming each word in the string is separated by
			stSeparator. This function is always used along with
			GetAWordFromString and should be called before
			cating GeLAWordFrom String.
GetAWordFromStri	Public	PerseMeeting Text,	This function extracts the ith word of the
E.	Function	ProcessSup	string(sttnEvalString) assuming that each word in the
(BF.Parse)		Ŧ	string is separated by a designated separator contained
			in the variable stSeparator. In most cases, use this
		-	function with DetermineNumWords. The function returns
			the wanted word. This function checks to make sure that
			ilnWordNum is within bounds to that i is not greater
			than the total number of words in string or less
			than/equal to zero. If it is out of bounds, we return
			empty string to indicate we can't get anything. We by to
			make sure this doesn't happen by cating
			DetermineNumWords first.
ParseAndCleanPhr	Private	ParseMeetingText	This function first grabs the word and send it to
886	Function		CleanWord in order strip the stuff that nobody wants.
(BF.Parse)	•••••		There are things in parseWord that will till the word, so
			we will need a method of looping through the body and
			rejecting words without killing the whole function i guess
			keep CleanWord and check a return vatue
		٠	ok, now I have a word so I need to send it down the
			parse chain. This chain goes PerseCleanPhrese ->
			CleanWord -> EvaluateWord. If the word gets through
			the entire chain without being killed, it will be added at
			the end to our keyward string.
			first would be the function that checks for "/" as a
			delimiter and extracts the parts of that. This I will call
			"StitchFace" (Denise is more normal and calls it
			GetAWordFromString}
			if this finds words, then each of these will be sent, in
			tum, down the chain. If these get through the entire

÷

WO 00/31664

PCT/US99/27218

Procedure Name	adkı	Called by	
			chain without being added or killed then they will be
			added rather than tossed.
FindMin	Private	ParseAndCleanPhrase	This function takes in 6 Input values and evaluates to
(BF.Parse)	Function		see what the minimum non zero value is. It first creates
			an array as a holder so that we can sort the five input
			values in ascending order. Thus the minimum value will
			be the first non zero value element of the erray. If we go
			through entire array without finding a non zero value, we
			know that there is an error and we exit the function.
CleanWord	Private	ParseAndCleanPhrase	This function tries to clean up a word in a meeting text. It
(BF. Parse)	Function		first of all determines if the string is of a valid length. It
			then passes it through a series of tests to see it Is clean
			and when needed, it will edit the word and strip
			unnecessary characters off of it. Such tests includes
			getting rid of file extensions, non chars, numbers etc.
EvaluateWord	Private	ParseAndCleanPhrase	This function lests to see if this word is in the stop list so
(BF.Parse)	Function		it can determine whether to eliminate the word from the
			original meeting taxt. If a word is not in the stoplist, it
			should stay around as a keyword and this function exits
			beautifully with no errors. However, if the words is a
			stopword, an error must be returned. We must properly
		•	delimit the input test string so we don't accidentally
			retrieve sub strings.
GoPattarnMatch	Public Sub	GoBF	This procedure is called when our QueryMethod is set to
(BF. PatternMatch)			complex query meaning we do want to do all the pattern
			matching stuff.it 's a simple wrapper function which
			initializes some arrays and then invokes pattern
			matching on the title and the body.
MatchPatterns	Public Sub	GoPattern Match	This procedure loops through every pattern in the
(BF.PatternMatch)			pattern table and tries to identify different fields within a
			meeting text specified by sinEvalString. For debugging
			purposes it also tries to tabulate how many times a
			certain patiem was triggered and stores it in
			gTabustaMatches to see whichp pattern fined the most.
			gTabulateMatches is stored as a global because we
			want to be able to run a batch file of 40 or 50 test strings
			and still be able to know how often a pattern was

-55-

7/28/2006, EAST Version: 2.0.3.0

PCT/US99/27218

			nondinear in
			Diggerad.
MatchAPattern	Private	MatchPatterns	This function goes through each element in the
(BF.PatternMatch)	Function		current pattern. It first evaluates to determine
			whether element is a placeholder or an indicator. If it
			is a placeholder, then it will try to bind the
			placeholder with some value. If it is an indicator,
		•	then we try to locate it. There is a trick however.
			Depending on whether we are at current element is
			the head of the pattern or not we want to take
			different actions. If we are at the head, we want to
		•	look for the indicator or the placeholder. If we can't
		•	find it, then we know that the current pattern doesn't
			exist and we quit. However, if it is not the head, then
,			we continue tooking, because there may still be a
			head somewhere. We retry in this case.
gField	Private	MatchAPattern	This function uses a big switch statement to first
(BF.PatternMatch)	Function		determine what kind of placeholder we are talking about
			and depending on what type of placeholder, we have
			specific requirements and different binding criteria as
			specified in the subsequent functions called such as
			BindNames, BindTime etc. If binding is successful we
			add it to our guessing record.
BindNames	Private	MatchMeetingField	in this function, we try to match names to the
(BF.PatternMatch)	Function		corresponding placeholder SPEOPLES. Names are
			defined as any consecutive two words which are
			capitalized. We also what to retrieve a series of names
			which are connected by and , or & so we look until we
			don't see any of these 3 separators anymore. Note that
			we don't want to bind single word names because it is
			probably too general anyway so we don't want to
			produce broad but irrelevant results. This function calls
			BindAFullName which binds one name so in a since
			BindNames collects all the results from BindAFuttName
BindAFullName	Private	BindNames	This function tries to bind a full name. If the SPEOPLES
(BF.PatternMatch)	Function		placeholder is not the head of the pattern, we know that
			it has to come right at the beginning of the test string
			because we've been deleting stuff off the head of the

\$

WO 00/31664

PCT/US99/27218

Procedure Name	1ype	Called By	Description
			string all along. If it is the head, we sourch until we find
			something that looks like a full name. If we can't find it,
			then there's no such pattern in the text entirely and we
			quit entirely from this pattern. This should eventually
			return us to the next pattern in MatchiPatterns.
GetNextWordAfter	Private	BindAFuil	This function grabs the next word in a test string. It
WhiteSpace	Function	Name, BindTime.	looks for the next word after white spaces, @ or /. The
(8F.PatternMatch)		BindCompanyTopicLo	word is defined to end when we encounter another one
			of these white spaces or separators.
BindTime	Private	MatchMeetingField	Get the immediate next word and see if a looks like a
(BF.PatternMatch)	Function		time pattern. If so we've found a time and so we want to
			add it to the record. We probably should add more time
			patterns. But people don't seem to like to enter the time
			in their titles these days especially since we now have
			tools like OutLook.
BindCompanyTopi	Private	MatchMeetingField	This function finds a continuous capitalized string and
glo	Function		binds it to stMatch which is passed by reference from
(BF.PattomMatch)			MatchMaetingField. A continous capitalized string is a
			sequence of capitalized words which are not Interrupted
			by things like, . etc. There's probably more stuff we can
			add to the list of interruptions.
LocataPatternHea	Private	MatchAPattern	This function tries to locate an element which is an
o	Function		indicator. Note that this indicator SHOULD BE AT THE
(BF.PalternMatch)			HEAD of the pattern otherwise it would have gone to the
			function LocateIndicator Instead. Therefore, we keep on
			grabbing the next word until either there's no word for us
			to grab (quit) or it we find one of the indicators we are
			looking for.
ContaintnArray	Private	LocatePattem	This function is really simple. It loops through all the
(BF.PatternMatch)	Function	Head, LocateIndicator	elements in the array ' to find a matching string.
Localeindicator	Private	MatchAPattern	This function tries to locate an element which is an
(BF.PatternMatch)	Function		Indicator. Note that this indicator is NOT at the head of
			the pattern otherwise it would have gone to
			LocatePattemHead instead. Because of this, if our
			pationn is to be satisfied, the next word we grab HAS to
			be the indicator or else we would have failed. Thus we
			ortly grab one word, test to see if it is a vatid indicator

\$

Procedure Name	Туре	Called By	Description
			and then return result.
Initializa Guesses R	Private Sub	MatchAPattern	This function reinitializes our temporary test structure
ecou			because we have already transfered the info to the
(BF.PatternMatch)			permanent structure, we can reinitialize it so they each
			have one element
AddToMeetingRec	Private Sub	MatchAPattern	This function is only called when we know that the
guo.			information stored in UnCurrGuesses is valid meaning
(BF.PatternMatch)			that it represents legitamate guesses of meeting fields
			ready to be stored in the permanent
			record, fin Meeting Record. We check to make sure that
			we do not store duplicates and we also what to clean up
			what we want to store so that there's no cluttered crap
	•		such as punctuations, etc. The reason why we don't
			clean up until now is to save time. We don't waste
			resources caling ParseAndCleanPhrase until we know
			for sure that we are going to add it permanently.
NoDupicateEntry	Private	AddToMeetingRecord	This function loops through each element in the array to
(BF.PatternMatch)	Function		make sure that the test string aString is not the same as
			ony of the strings already stored in the array. Slightly
			different from ContaintnArray.
SearchAltaVista	Public	GoBackGroundFinder	This function prepares a query to be submitted to
(BF.Search)	Function		AltaVista Search engine. It submits it and then parses
			the returning result in the appropriate formal containing
			the title, URL and body/summary of each story
			retriaved. The number of stories retriaved is specified
			by the constant NUM_AV_STORIES.
			important variables include stURLAliaVista used to store
			query to submit stResutHTML used to store html from
			page specified by stURLAliaVista.
ConstructAltaVista	Private	SearchAttaVista	This function constructs the URL string for the alla vista
rki N	Function		search engine using the advanced query search mode.
(BF.Search)			It includes the keywords to be used, the language and
			how we want to rank the search. Depending on whether
			we want to use the results of our pattern matching unit,
			we construct our query differently.
ConstructSimpleKe	Private	ConstructAttaVistaURI,	This function marches down the list of keywords stored
yWord	Function	ConstructNewsPageU	in the stTitleKW or stBodyKW fields of the input meeting

Figure 6 is a fowchart of the actual code utilized to prepare and submit searches to the Alta Vista and Newspage search engines in accordance with a preferred embodiment. Processing commences at function block 610 where a command line is utilized to update a calendar entry with specific calendar information. The message is next posted in accordance with function block 620 and a meeting record is created to store the current meeting information in accordance with function block 440 the query is submitted to the Alta Vista search engine and in function block 650, the query is submitted to the Alewspage search engine. When a message is returned from the search engine, it is stored in a results data structure as shown in function block 650 and the information is processed and stored in summary form in a file for use in preparation for the meeting as detailed in function block 670.

2

Figure 7 provides more detail on creating the query in accordance with a preferred embodiment. Processing commiscres at function block 710 where the mealing record is parsed to obtain potential companies, people, topics, location and a time. Then, in function block 720, at least one company name is identified and in function block 720, at least one company name is identified and thatly in function block 740, a decision is made on what material to transmit to the file for utilizate consumption by the user.

Figure 8 is a variation on the query theme presented in Figure 7. A meeting record is parsed in function block 800, a company is identified in function block 820, a bopic is identified in function block 820 a bopic is identified in function block 820 into topic and or the company is utilized in formulating the query.

15

WO 00/31664 - PCT/US99/27218

Alternative embodiments for adding various specific foatures for specific user requirements are discussed below.

Enhance Target Rate for Pattern Matching

To increase Bif's performance, more pathemybathem groups are added to the procedure "Crebab Pathems". The existing code for declaring pathems can be used as a temptale for future pathems. Because everything is stored as opnamic erray, it is convenient to rouse code by outling and passing. The fundions BindName, BindTame, BindCompanyLocTopic which are responsible for associating a value with a pisocholder can be enhanced. The enhancement is realized by increasing the set of criteria by binding a certain meeting field in order to increase the number of binding values. For example, BindTame currently accepts and baids and totals to the form of \$41\pi or \$1\pi or \$1\pi or \$2\pi or \$

2

2

ន

53

Depending on what location the system thenlifes through pattern matching or attensively depending on what location the user indicases as the meeting place, a system in accordance with a preferred embodiment suggests a plurality of fine restaurants whenever it detects the words functivitane/foreakfast. We can also use a site like company finder to confirm what we got is indeed a company name or if there is no company name that pattern matching can identify, we can use a company finder web site as a 'dictionary' for us to determine whether certain capitalized words represent a company name. We can even display stock prizes and breaking news for a company that we have identified.

Wireless Bargain Identification in Accordance With A Preferred Embodiment

Figure 8 is a flow disgram that depicts the hardwere and togical flow of control for a device and a software system designad to allow Web-based comparison shopping in conventional, physical, non-Web beal environments. A writeless phone or similar hand-hed wreless device 820 with internet Protocol capability is combined with a miniature betocode reader 810 (installed either inside the phone or on a short cable) and used to scan the Universal Product Gode (UPC) ber code on a book or other product 900. The writeless device 820 transmits the bar code was an enternal 870 to the Pockat BargainFinder Service Module (norming on a Web service) 440, which convents it to (in the case of books) its leternational Standard Book Number or (in the case of other products) whatever identifier is appropriate. The Service Module then contacts the appropriate britishy who site(s) to find product sylving and enablashy information on the product from various Web suppliers 950. This information is formationed displayed on the hand-hed derice's screen. The IP writeless phone or other hand held device 920 tilizes a writeless nodem such as a Roccerte SE Weressa Modem from Metricom. Utilizing this device, a user can hang out in a coffee shop with a portuble computer perchad on a ricky still the bask, with a lattle shosting dampercusty close to the Neyboard, and access the Internet at speects whating direct connect via a (Rebphone in).

8

33

The B-ounce Ricochel SE Wreless Modem is ebout as large as a pack of organellas and sebup is extremely simple, simply attach The modem to the back of your portable's screen with the included piece of Veicro, plug the cable into the estral port. Hip up the

WO 00/31664

PCT/US99/1718

stubby antenna, and transmit. Software setup is equally easy, a straightforward tralatier adds the Ricochet modern drivers and places the comection icon on your desting. The fundoreal aspects of the modern are identical to that of a traditional telephone modern.

modern.

5 Of course, wivaless performance isn't nearly as reliable as a traditional dial-up phone connection. We were able to get strong connections in several San Francisco locations as long as we stayed near the windows. But inside CNET's all-brick headquarters, the Ricochet couldn't connect at all. When you do get online, performance of up to 28.8 kbps is evaliable with graceful degradation to stower speeds. But even the slower speeds drin't disappoint. Compared to the attention-connecting via a cellular modern—the Ricochet is much faster, more releable, and less expensive to use. Naturally, the SE Wireless is batter) powered. The modern has conflueus battery file of up to 12 hours. And in accordance with a preferred embodiment, we ran down our portable computer's dual cells before the Ricochet started to lade.

Thus, utilizing the wireless modern, a user may utilize the web server software 940 to identity the right product 850 and then use an appropriate device's key(s) to select a supplier and place an order in accordance with a preterred embodiment. The BargainFinder Service Module then consummates the order with the appropriate third-party Web supplier 950.

ģ

PCT/US99/27218

Egocentric Interface

An Egocantric interface is a user interface crafted to substy a particular user's needs, preferences and current contact. It utilizes the user's personal information that is stored in a central profile diabbase to customize the interface. The user can set escurity permissions on and preterences for interface elements and content. The content integrated into the Egocantric Interface is customized with related information about the user. When displaying content, the Egocantric interface will inducte the relationship between that content and the user in a way that demonstrates how the content relates to the user. For instance, when displaying information about an upcoming six thip the user has signed up for, the interface will indude information about events from the user's personal celendar and content is used as other people who will be in the area during the six trip. This serves to put the new piece of information into a content familiar to the Individual user.

S

2

Figure 1dA describes the Intantion Value Network Architecture implementation for the World Wide Web. For striptification purposes, this diagram ignores the complexity pertaining its security, scalability and privacy. The customer can access the Intention Value Network with any internet web browers froit, such as Netscape Navigation Advisored Internet Explorer, running on a personal computer connected to the Intention of Personal Orginal Assistant with wireless capability. See Figure 17 for a note detailed description of the multiple methods for excessing an Intention Value Network. The customer accesses the Intention Value Network through the unique neme or it address associated with the Integrator's Web Server 1920. The Integrator catals the Intention Obatabase 1930, the Committed Comban Database 1940, the Supplier Profile Database 1930, and the Customer Profile Database 1950.

2

The Intention Database 1030 stores at of the information about the structure of the Intention and the types of products and services needed to fulfill the intention, information in this database includes intention steps, areas of interest, layout temptates and personalization temptates. The Content Database 1040 stores atl of the information related to the intention, such as advice, referral information, personalization content, seastaction ratings, product ratings and progress reports.

20

52

ಜ

The Supplier Profile Database 1050 contains information about the product and service providers integrated into the intention.

The Information contained in this database provides a fart between the intention framework and the suppliers. It includes product lists, features and descriptions, and addresses of the suppliers' product web sites. The Customer Profile Database 1050 contains personal information about the customers, such as name, address, social security number and credit card information, personal preferences, behavioral information, history, and web site layout preferences. The Supplier's Web Server 1070 provides occess to all of the eupplier's databases necessary to provide information and transactional support to the oustomer.

The Product Information Database 1080 stores all product-related information, such as fratures, evalability and pricing. The Product Order Database 1090 stores all customer orders. The interface to this database may be through an Enterprise Resource Planning application offered by SAP, Bsan, Oracle or others, or it may be accessible directly through the Supplier's Web Server or application server. The Customer Information Database 1091 stores all of the outstoner information that the supplier needs to complete a transaction or maintain outstoner records.

WO 00/31664

PCT/US99/27218

Figure 10B is a flowchart providing the logic utilized to create a web page within the Egocentric trianface. The environment assumes a web server and a web browser connected through a TCP/IIP network, such as over the public Internal or a private intranel. Possible web server and a web browser connected through a TCP/IIP network, such as over the public Internal or a private intranel. Possible web tenner could include Microsoft Internal England or Netscape Navigation. The define (i.e. web browser) makes a request 1001 to the server (i.e. web server) for a particular web page. This is leusely accomplished by a user dicking on a button for a fin within a web page. The veb server gats the signal and content preferences 1002 for the publication uses with the request to the distallate server of a unique user if stand in the client (i.e. web browser) and the User profile distallates 1003. The web server then retrieved 1006. (See Figure 11 or a nore detailed description of this process.) The query to the distallates utilizes the content preferences stored as part of the user profile in the User profile abbases 1003. The query to the distallate user content preferences stored as part of the user profile in the User profile abbases 1003 to failer the content that is returned. The web page is then natured in to the distallate by the user profile. The web page 1007 eccading to the layout preferences defined in the user profile. The web page is then natured in the the User profile and displayed to the user 1008.

to the users and usprayou to be user 1909.

Figure 11 describes the process of retrieving user-centric content to add to a web page. This process describes 1006 in Figure 1008 in a more detailed tashion. It assumes that the server already has obtained the user profile and the existing content that is

to find any user-centric content 1120 stored in various databases. This involves matching the tagged liems in the temporary storage space with calendar items 1130 in the Calendar Dalabase 1140; email items 1115 in the Email Dalabase 11141; contact items 1117 in the Contact Dalabase 1168; bask fist items 1119 in the Table Dalabase 1169; bask fist items 1119 in the Table Dalabase 1120. After retileving any relorant user-centric contact, it is complete together and returned 1122.

and email addresses. If any of these are found, they are tagged and stored in a temporary holding space. Then, the server tries

going to be integrated into this page. The server parses 1110 the diared content, booking for instances of events, contact names

User Persons

The system allows the user to create a number of different personas that aggregate profile information into sets that ore useful in different contexts. A user may create one persona when making purchases for his home. This persona may contain his home address and may indicate that this user is boding to find a good bangain when shopping. The same user may create a second persona that can be used when he is in a work context. This persona may store the user's work address and may indicate that the user prefers certain vendors or works for a certain company that has a discount program in place. When shopping for work-related tiems, the user may use this persona may also contain nutes and restrictions. For instance, the work possona may reaso contain nutes and restrictions. For instance, the work possona may restrict the user to making airtine reservations with only one travel agent and utilizing booking rules set up by this employer.

25

2

Figure 12 describes the relationship between a user, his multiple personas and his multiple profiles. At the User Level is the User Profile 1200. This profile describes the user and his account information. There is one uniquo record in the databases for each user who has an account. Attached to each user are multiple Personas 1220, 1230 & 1240. These Personas are used to group multiple Profiles into useful contexts. For instance, consider a user who lives in San Francisco and works in Palo Alto, but has a mountain cabin in Lake Tahoe. He has three different contexts in which he might be accessing his site. One context is work-related. The other two are home-file related, but in different iocations. The user can create a Persona for Work 1220, a Persona for his cabin home 1240. Each Persona reterences a different General Profile 1250,

35

PCT/US99/27218

refundable fairs, since they are generally cheaper. Both the Persona for Home and the Persona for the cabin home point to the Business or First Class and his preferred aidline is United Aldines. The Work Persons references this Work Travel Profile. The references one of two Travel Profiles. The user maintains a Work Travel Profile 1280 that contains all of the business rules 1260 and 1270 which contains the address for that location. Hence, there are three General Profiles. Each Persona also user may also maintain a Home Travel Profile 1290 that specifies that he prefers to travel in coach and wants to find nonrelated to booking tickets and making reservations. This Profile may specify, for instance, that this person only travels in tome Travel Profile.

S

2

contains a set of Permissions 1390 that are contained in that record. These permissions dictate who has what access rights to pattarn like (if x then y), which allows the Rule to be restricted to certain uses. An example Profile Restriction would be the rule who has an account in the system. This table contains a usemame and a password 1320 as well as a unique identifier. Each contain the detailed personal information in Profile Fleid 1350 records. Attached to each Profile are sets of Profile Restriction Figure 13 describes the data model that supports the Persona concept. The user table 1310 contains a record for each user user can have multiple Personas 1310, which act as containers for more specialized structures called Profiles 1340. Profiles 1350 records. These each contain a Name 1370 and a Rule 1380, which define the restriction. The Rule is in the form of a contained in the "Travel" Profile of the "Work" Persona set up by the user's employer, for instance. Each Profile Field also that dictates that the user cannot book a flight on a certain airline contained in the fist. This Profile Restriction could be hat particular Profile Fleld's Information.

2

Intention-Centric Interface

20

25

transportation to heatthcare, personal and professional development, and entertainment, among others. Satisfying Intentions Sabshying Qustomer Intentions, such as Planning for Retriement or Relocating requires a specialized interface. Qustomer ntentions require extensive planning and coordination across many areas, ranging from financial security, housing and equires a network of complamentary businesses, working across industries, to help meet consumers' needs.

allows the user to manage the process of satisfying that particular Intention. This involves a saries of discrete steps and a set of content areas the user can access. At any point, the user can also switch the interface to manage a different intention, and this An Intention-Centric Interface is a user interface designed to help the user manage personal Intentions. At any given point, the ect will change the content of the interface to Indude only that content which is relevant to the satisfaction of the newly safected interface content is customized to show only content that relates to that particular intention. The Intention-Centric Interface

8

also keeps track of Intention Step 1470 completion status. The Completion 1480 fleid indicates whether the user has completed interaction with the user. For instance, if the user had filled out a form on the screen and one of the fields was Social Security Number, the corresponding Data Field would contain Name = "SSN" 1450, Value = "999-99-9999" 1460. Each User Intention Intantions 1420. Each active User Intention is given a Nickname 1430, which is the display name the user sees on the sozeen Each active User Intention also contains a number of Data Fields 1440, which contain any user data collected throughout the Persona 1410 (see Figure 13 for a more detailed description of the Persona data model.) has any number of active User Figure 14 provides a detailed description of the data model needed to support an intention-Centric Interface. Each User

35

WO 00/31664

PCT/US99/27218

the step. Every User Intention is a user-specific version of a Genoric Intention 1490, which is the default model for that intention the Intention. These Custom Rules are patterns describing how the system will customize the Intention for each Individual user for all users. The Generic Intantion is customized through Custom Rubss 1411 and 1412 that are attached to the sub-staps in using the individual user's profile information.

S

Statistical Agent

reality pet toy to encourage certain behaviors from the user. The statistics that are recorded are frequency of login, frequency of rating of content such as news articles, and activity of agents, measured by the number of lasks which it performs in a certain An agent keeps track of key statistics for each user. These statistics are used in a manner similar to the Tamogochi virtual period. This information is used by the system to emotionally appeal to the user to encourage certain behaviors.

2

Graphs are then generated 1570 using the generic formulas and that user's statistics. Those graphs are trashed into a template Figure 15 describes the process for generaling the page that displays the agent's current statistics. When the user requests the agent stabistics page 1510 with the client browser, the server retrieves the usors' statistics 1520 from the userr' profile database server then retrieves the formulas 1530 from the content database 1560 that will be used to calculate the user-centric statistics. 1530. The server then performs the mathematical calculations necessary to create a normalized set of statistics 1540. The to create the statistics page 1580. This page is then returned to the user 1590.

Personal Profile and Services Ubiquity

This system provides one central storage place for a person's profile. This storage place is a server available through the public accessibility of the profile, numerous access devices can be used to customize services for the user based on his profile. For version stored in the Internet site. This enables the person to only have to maintain one version of this data in order to have it example, a merchant's web sits can use this profite to provide personalized content to the user. A Personal Digital Assistant PDA) with internet access can synchronize the person's calendar, email, contact list, task list and notes on the PDA with the Internet, accessible by any device that is connected to the internet and has appropriate access. Because of the ubiquitous available whenever it is needed and in whatever formats it is needed.

Š

2

profile database 1710 is the central storage place for the users' profile information. The profile gateway server 1720 receives ell Figure 17 presents the detailed logic associated with the many different methods for accessing this contrally stored profile. The permission. Any device that can access the public internet 1730 over TCP/IP (a standard network communications protocol) is requests for profile information, whether from the user thinself or merchants bying to provide a service to the user. The profile able to request information from the profile database via intelligent HTTP requests. Consumers will be able to gain access to Likewise, merchants 1750 will be able to access those profiles (given permission from the consumer who owns each profile). gateway server is responsible for ensuring that information is only given out when the profile owner specifically grents appliances, security systems, desktop computers, taptops, pocket organizers, PDAs, and their vehicles, among others. services from devices such as their televisions 1740, mobile phones. Smart Cards, gas meters, water meters, kitchen and will be able to offer customized, personalized services to consumers because of this.

2

20

information as well as preferences for hold room, etc. The holds can also access the consumer's movie and dining preferences One possible use of the ubiquitous profile is for a hotel chain. A consumer can carry a Smart Card that holds a digital certificate know the person checked into the hotel and is safe. All transaction information can be uploaded to the consumer's profile after profile galeway server (using a secure transmission protocol) and is authenticated. The hotel is then given accass to a certain swipes the Smart Card and the consumer enters his Pin number, untocking the digital cartificate. The certificate is sent to me and offer customized menus for both of them. The hotal can offer to send an email to the consumer's spouse latting himher the hotel checks him in. This will allow partners of the hotel to utilize the information about the consumer that the hotel has information into the profile database. The consumer brings this card into a hotel chain and checks in. The hotel employee part of the consumer's profile that he has previously specified. The hotel can then retrieve all of the consumer's billing uniquely identifying him. This Smart Card's digital certificate has been issued by the system and it recorded his profile gathered (again, given the consumer's permission). 8

53

Intention Value Network

integrator manages a network of approved suppliers providing products and services, both physical and virtual, to a user based in an Intention Value Network, the overall integrator system coordinates the delivery of products and services for a user. The on the user's preferences as reflected in the user's profile. The integrator manages the relationship between suppliers and consumers and coordinates the suppliers' fulfillment of consumers' intentions. It does this by providing the consumer with information about products and suppliers and offering objective advice, among other things.

33

33

WO 00/31664

PCT/US99/27218

Figure 18 discloses the detailed interaction between a consumer and the integrator involving one supplier. The user accesses s browser to the integrator's WebApplication Server 1820. The user's preferences and personal information is obtained from en integrator's customer profile database 1830 and naturaed to the Web/Application server. The requested product information is extracted from the supplier's product database 1840 and customized for the particular customer. The Web/Application servar updates the supplier's customer information database 1850 with the inquiry information about the customer. The product and Web Browser 1810 and requests product and pricing information from the integrator. The request is sont from the user's pricing information is then formatted into a Web Page 1880 and returned to the customer's Web Browser.

Summary Agent

2

15

tasks for the user. The egents work according to rules set up by the usor and are only allowed to porform tasks explicitly defined by the user. The egents can lake care of paying bills for the user, filtering contant and emails, and providing a summany view of A suite of software agents running on the application and web servers are programmed to take care of repetitive or mundane tasks and agent activity. The user interface for the agent can be modified to suit the particular user.

Figure 18 discloses the logic in accordance with a preferred embodiment processing by an agent to generate a verbal summary egent type, rules and summary level from the user profile database 1930. The server gets the content 1940, such as ematts, to do list items, news, and bills, from the content database 1950. The agent parses all of this content, using the rules stored in the profits database, and summarizes the content 1960. The content is formatted into a web page 1970 according to a template. The text for the agent's speech is generated 1980, using the content from the content database 1990 and speech templates for the user. When the user requests the summary page 1900, the server gets the user's agent preferences 1920, such as stored in the database. This speech taxl is inserted into the web page 1995 and the page is returned to the user 1997.

2

Trusted Third Party

The above scenario requires the web site to maintain a guarantee of privacy of information according to a published policy. This rather than on the side of stimulation of commerce opportunities. The Trusted Third Party has a set of processes in place that system is the consumer's Trustad Third Party, acting on his behalf in every case, erring on the side of privacy of information, guarantee certain complicity with the stated policy.

52

"moCommerce"

This word extends the word "eCommerce" to mean 'personalized electronic commerce."

8

A user enters a username at 2010 and a password at 2020 and selects a button 2040 to initiate the login procedure. As the logo customize and personalize various system components to gather information and interact with the user's personal requirements. Figure 20 Bustrates a display login in accordance with a preferred embodiment. The display is implemented as a Microsoft Internst Explorer application with an agent 2000 that guides a usor through the process of interacting with the system to 2000 suggests, the eystem transforms electronic commerce into a personalized, so called "me" commerce

including travel 2110, household chores 2120, finances 2130 and markolplace activities 2140. Icons 2142 for routine tasks such animated agent 2100 with a personalized message 2190. The user can select from various activities based on requirements Figure 21 libratrates a managing daily logistics display in accordance with a preferred embodiment. A user is greeted by an

PCT/US99/27218

as e-mail, calendaring and document preparation are also provided to facilitate rapid navigation from one activity to another.

Otroct lank 2148 are also provided to allow transfer of news and other items of interest. Various profiles can be selected based on where the user is located. For example, work, home or vacation. The profiles can be added 2170 as a user requires a new profile for another boation. Various items 2180 of personal information are collected from the user to support various endeavors. Moreover, permissions 2150 are set for items 2180 to assure information is limitly and current.

Š

Figure 22 Bustrators a user main display in accordance with a preferred embodiment. World 2200 and local news 2210 is provided based on a user's preference. The user has also selected real estate 2230 as an item to provide direct information on the main display. Also, a different agent 2220 is provided based on the user's preference.

2

Figure 22 Bustrates an agent interaction in accordance with a preferred embodiment. The agent 2310 is communicating information 2300 to a user indicating that the user's life insurance needs have changed and pointing the user to the chart that best summarizes the information for the user. Particular tips 2395 are provided to facilitate more detailed information based on current user statistics. A chart 2370 of the user's life insurance needs is also highlighted at the center of the display to assist the user in determining appropriate action. A button 2380 is provided to facilitate changing the policy and a set of buttons 2390 are provided to assist a user in selecting various views of the user's insurance requirements.

2

Event Background

An Event Backgrounder is a short description of an upcoming event that is sent to the user just before an event. The Event Backgrounder is constantly updated with the latest information related to this event. Perthent information such as titnerary and logistics are included, and other useful information, such as people the user knows who might be in the same location, are also included. The purpose of the Event Backgrounder is to provide the most up-to-date information about an event, drawing from a number of resources, such as public web sites and the user's calendar and contact ists, to allow the user to react optimally in a given situation.

2

Vicinity Friend Finder

52

This software books for opportunities to let the user when a thiend, family member or acquaintance is or is going to be in the same vicinity as the user. This software scans the user's calendar for upcoming events. If then uses a geographic map to compare flouse calendar events with the calendar events of people who are listed in his contact list. If then informs the user of any matches, thus telling the user that someone is scheduled to be near him at a particular time.

Information Overload

8

The term information overfood is now relatively understood in both its definition as well as its implications and consequences. People have a faille amount of attention that is evaliable at any one time, but there is more and more vying for that attention every day. In short, too much information and bot title time are the primary factions complicating the lives of most knowledge workers today. The first extempts to dynamically deal with information overload were primarily facused on the intelligent fillening of information such that the quantity of information would be lessened. Rather than simply removing random bits of information, however, most such that the quantity of information, however, most such that the quantity of information would be lessened.

32

WO 00/31664

PCT/US99/27218

of these approaches tried to be intelligent about what information was ultimately presented to the user. This was accomplished by evaluating each document based on the user's interests and discarding the less relevant ones. It follows, therefore, that the quelity was also increased.

Filtering the information is only a first step in dealing with information is this new ago. Argusbly, just as important as the quadry of the document is having ready access to it. Once you have entered a meeting, a document containing critical information about the meeting subject defivered to your office is of tittle value. As the speed of business continues to increase thelied by the technologies of interconnectedness, the ability to receive quality information wherever and whenever you are bocomes critical. This new approach is called intelligent information defivery and is a new information age.

S

2

A preferred embodiment demonstrates the intelligent information delivery theory described above in an attempt ib not only reduce information overfload, but to deliver high quality information where and when users' require it, in other words, the system delivers right information to the right person at the right time and the right pace.

15 Active Knowledge Management System Description

Figure 24 is a block diagram of an active browiedge managament system in accordance with a preferred embodiment. The system constats of the fullowing parts: back-and 2400 connection to one or more servers, personal mobile wineless clients (Awareness Machine) 2430, 2436, public deens (Magic Well) 2410, 2420, web clicnts 2446, 2448, e-mail clients 2450, 2460.

20 Back-end Server (2400) Processes

Figure 25 is a block degram of a back and server in accordance with a preferred embodiment. The back-end (2400 of Figure 24) is a computer system that has the following software extiver intelligent Agents Coordinator (Murin) 2580, Information Prioritzation Subsystem 2530, a set of continuously and periodically running information gathering and processing intelligent Agents 2500, 2502 and 2504, User Profiles Database 2542 and expoorting tothware, Information Chrannels Database 2542 and supporting software 2560, and auxiliary software.

The Awareness Machine (2446 & 2448 of Figure 24)

25

The Awareness Machine is a combination of hardware device and software application. The hardware consists of handhald personal computer and wireless communications device. The Awareness Machine reflects a constantly updated state-of-the-owner's-world by continually receiving a wireless trickle of information. This information, minod and processed by a suite of intelligent agents, consists of mail messages, news that meets each user's preferences, achockle updates, background information on upcoming meetings and events, as well as weather and traffic. The Awareness Machine is covered by another patent application.

8

Figure 26 is a block diagram of a magic wat in accordance with a preferred embodiment.

33

The Magic Wall

The Magic Wall hardware includes:

Ŗ

WO 00/31664 PCT/US99/27218

- Computer system 2640 connected to the back-end server
- Sensor array 2634, 2630 and 2632 detacts presence, position, and Identity of a person
- Large touch-sensitive display 2520
- Sound input 2610 /output 2614 hardware

Š

The Magic Wall software supports:

- Multimedia output compatible with current Web standards
- Speech recognition
- Tactile input

으

Intelligent agents representations in the form of speech-enabled animated characters

The Magic Wall operates as follows:

- If a user appears in the vicinity of Magic Wall, the sensor array triggers tuser here's event that sends an environmental cue containing the person's kill and the location to the Inteligent Agent Coordinator.
- User is identified based on the information returned by the sensor array.

2

- The Magic Wall switches to Tocked on the user mode. If another user approaches, the system will notify him or her that it cannot serve enother user while the current user is being served.
- Intelligent Agent Coordinator is notified about the user presence.
- The Ineligent Agent Coordinator decides if there is pertinent to that user and Magie Wall location time-sensitive information to show (e.g. braffor report, meeting reminder). If such information exists, it is prepared for delivery. If not, control is transferred to the Information Phontization Subsystem.
- Enformation Prioritization Subsystem decides what information is most relevant to the user based on their personal profile, freshnass of the information, and the Intelligent Agent Coordinator's prior suggestions.
- The page of information identified as the most relevant to the user at this time and place is shown. The act of the
 information delivery can also include animation and speech output of the intelligent agent representation.

ĸ

- If user desires so, he or she can ask Magic Wall to show a particular page. The Magic Wall recognizes the speech fragment and then identifies and shows the requested page.
- 30 10. The Magic Wall switches back to the waiting state.

As the user departs from the Magic Wall area, the sensor array triggers 'user left' event

Other Clients

The Web client is a standard browser navigating to a sot of Web pages which allow user to see the same information that is evaluate via the Magic Well.

35 The e-mail client is any standard e-mail program.

Intelligent Agent Coordinator Description

ģ

7/28/2006, EAST Version: 2.0.3.0

WO 00/31664

PCT/US99/27218

This pieco of code is the coordinating agont (or meta-agont) for the Active Knowledge Management system. This means that all communications between the system and each uses, as well as communication between the different minion agents are handbed (coordinated) by the bitelitigent Agent Coordinator. Examples of these minion agents are:

- Background/Findor an agent that parses meeting text determining important knywords and phrases and thus background information on the meeting for each user
- TrafficFinder an agent that finds traffic information for each user based on where they live
- Several other agants that are responsible for doing statistical analysis of the data in each user's profile and updating fields perthent to that data

01

This Intelligent Agent Coordinator 2500 of Figure 23 is also the user's "interface" to the system, in that whenever the user interacts with the system, regardless of the GUI or other end-user interacts, they are ultimately dealing with (existing questions of or sending commends to) the intelligent Agent Coordinator. The intelligent Agent Coordinator has four primary responsibilities: 1) monitoring user activities, 2) handling information requests. 3) maintaining each user's profels, and 4) routing information to and from users and to and from the other respective agents.

Wonltoring User Activities

2

Anytime a user triggers a sensor the intelligent Agent Coordinator receives an "environmental cue". These cues not only enable the intelligent Agent Coordinator to gain an understanding where users' are for information delivery purposes, but also to learn the standard patterns ere constantly being updated and refined in an attempt to increase the system's intelligence when delivering information. For instance, today it is not uncommon for a postson to have several email accounts (work-based, forme-based, mobilo-bosed, att.) as well as several different computers involved in the retrieval process for all of these accounts. Thus, for the intelligent Agent Coordinator to be successful in delivering information to the correct location it must take into account all of these accounts and the times that the uses its likely to be accessing them in order to maximize the probability that the user will see the information. This will be discussed further in

2

Handling Information Requests

another section.

52

The Intalligent Agent Coordinator handles information requests from other agents in order to personalize information intended for each user and to more accurately reflect each user's intenests in the information they are given. These requests will commonly be related to the user's profile. For instance, if an agent was preparing a traffic report for a user it may request the traffic region (search string) of that user from the Intalligent Agent Coordinator. All access to the user's profile data is accessed in this

Maintaining User Profiles

8

Uter profiles contain extensive information about the users. This information is a blund of user-specified data end information that the intalligent Agent Coordinator has learned and extrapolated from each user's information and activities. In order to protect the data contained in the profiles, the Intelligent Agent Coordinator must handle all user information requests. The Intelligent Agent Coordinator wust handle all user information requests. The Intelligent Agent Coordinator is constantly modifying and updating these profiles by watching the user's activities and attempting to learn

PCT/US99/27218

the patients of their lives in order to assist in the more routine, mundane lasks. The intelligent Agent Coordinator also employs other agents to glean meaning from each user's delily activities. These agents mine this data thying to discover indications of current interests, long-term interests, as well as time delivery preferences for each type of Information. Another important aspect of the Intelligent Agent Coordinator's observations is that it also tries to distermine where each user is physically located throughout the day for routing purposes.

Information Routing

S

Massi people are mobile throughout their day. The intelligent Agent Coordinator tries to be sensitive to this fact by ettempting to determine, both by observation (unsupervised learning) and from cues from the environment, where users are or are Bitely to be located. This is certainly important for determining where to send the user's information, but also for determining in which format to send the information. For instance, if a user were as ther deals and using the web client, the ministent Agent Coordinator would be received the infulligent Agent Coordinator. because dealtop PCs are generally quite powerful, a full-bealured, graphically inforess version could be sent. However, consider an elementhe attainor: the full-figure Agent Coordinator Agent Coordinator are received an indication (via the keycard reader next to the east) that you have just left the building. Manutes later the Intelligent Agent Coordinator also receives notification that you have received an urgent message. The Intelligent Agent Coordinator, knowing that you have test the building and having not received any other indications, assumes that you are reactable via your handhad device (or which it also shows the capabilities) and sends the text of the urgant message there, retains a more graphically-oriented version.

2

Inherent Innovations

2

2

- The Active Knowledge Management system represents some of the most advanced trinking in the world of knowledge management and human computer interaction. Some of the primary innovations include the following:
 - The Intelligent Agent Coordinator as illustrated above.
- The development, demonstration, and realization of the theory of Inteligent Information Delivery
- Support for several channels of information defivery, all of which utilize a common back-end. For instance, if a user is in
 front of a Magic Wall the information will be presented in a multimodia-rich form. If the system determines that the user is
 mobile, the information will be sent by to their Awareness Machine in standard text. It facilitates delivery of information
 whenever and wherever a user requires the information.

52

- Personalization of information based not only on a static user profile, but also by taking into account history of the user interactions and current real-time stituation including "who, where, and when' awareness.
- 30 Utilization of fast and scalable Information Prioritization Subsystem that takes into account Intelligent Agents Coordinator ophiton, user preferences, and history of user interactions. It takes the load of mundane decisions off the Intelligent Agents part therefore atlowing the agents to be much more applicated and precise without compromising the system scalability.
 - Speech recognition and speech synthesis in combination with intaligent agent animated representation and tacille input
 provides for efficient, intaliere, and emotionally rewarding interaction with the system.

33

÷

The tollowing code is written and executed in the Microsoff Active Server Pages environment in accordance with a preferred embodiment. It consists primarily of Microsoft Jacipt with some database calls embedded in the code to query and store Supporting Code in Accordance With A Preferred Embodiment Create an intention ASP Page ("Intention_create.asp") <body bgcolor="#FFE9D5" style="font-family: Arial" laxt="#000000"> //intention_name = Request.Form("intention_name") //intention_desc = Request.Form("intention_desc") Intention_icon = Request.Form("Intention_icon") upl = Server.CreateObject("SoftArtisans.FileUp") intention_name = upl.Form("intention_name") intention_desc = upl.Form("Intention_desc") <titie>Create An Intention</tite> items = new Enumerator(upl.Form) submitted = upl.Form("submitted") information in the database. EIC' I

PCT/US99/27218

WO 00/31664

A computer program embodied on a computer-readable medium that creates a data model that supports user

a code segment that groups the user profile information in a togical manner; a code segment that obtains user profile information;

≘ £ £ €

information capture and storage, comprising:

a code segment that associates a unique name with the grouped user profile information; and

s code segment that stores the grouped user profile information and correlated name in a database

A computer program embodised on a computer-readable medium that creates an information summary as recited in claim 11, including logic that secures the grouped user profile information against access by an unauthorized user.

얻

A computer program embodied on a computer-readable medium that creates an information summary as recited in ij

ctain 11, including logic that customizes an application based on the current grouped user profile information

claim 11, including logic that updates the current grouped user profile information based on a user interaction with an A computer program embodied on a computer-readable medium that creates an information summary as recited in ≇

A computer program embodied on a computer-readable medium that creates an information summary as recited in claim 11, including logic that restricts information access based on the current grouped user profile Information 転

A computer program embodied on a computer-readable medium that creates an information summary as recited in

<u>5</u>

claim 11, including togic that stores rules indicative of information usage in the grouped user profile information.

A computer program embodied on a computer-readable medium that creates an information summary as recited in 17.

claim 11, including logic that shares lists of user profile information

A computer program embodied on a computer-readable medium that creates an information summary as recited in claim 11, wherein the profile information is grouped in an optimal manner for a target application 8

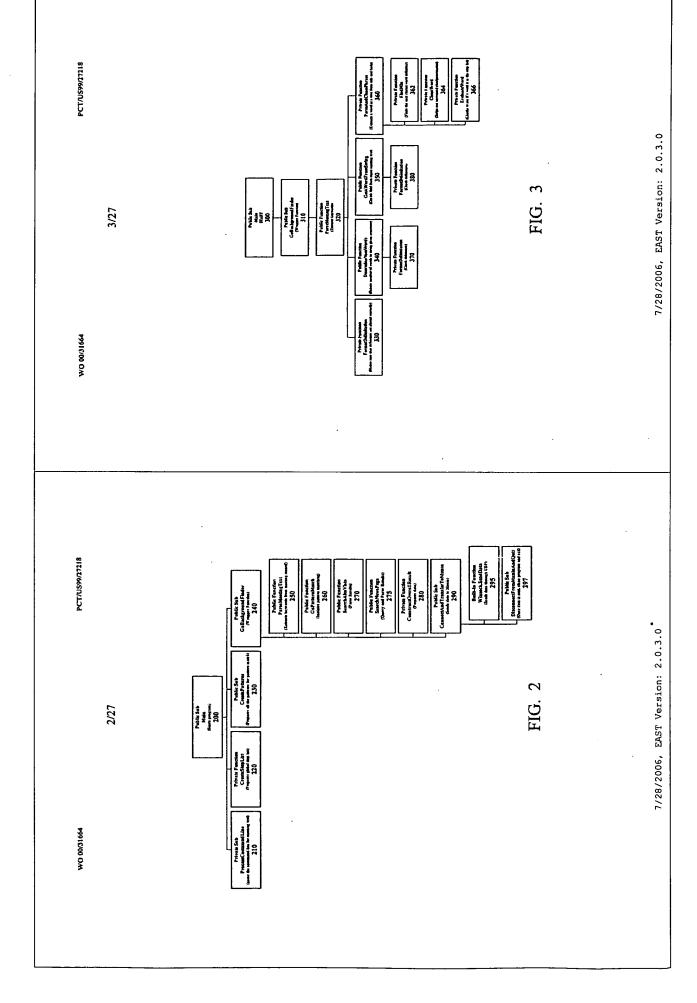

A computer program embodled on a computer-readable medium that creates an information summary as recited in 햔

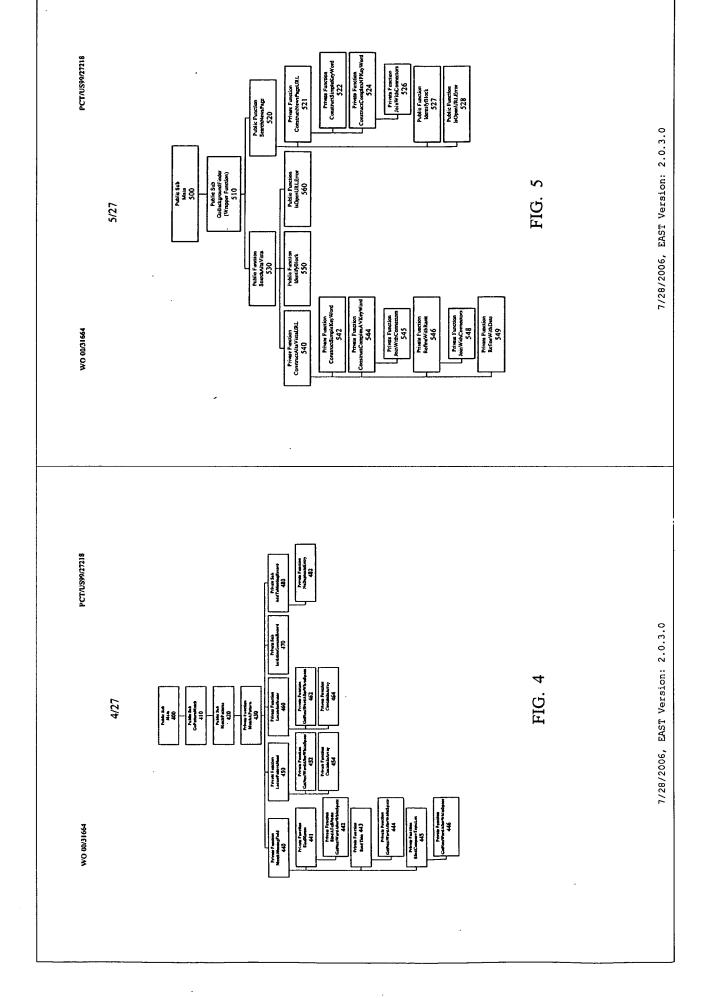

claim 11, including logic that provides access to the grouped profile information by a trusted third party.

BEST AVAILABLE IMAGES

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images include but are not limited to the items checked:

□ BLACK BORDERS
□ IMAGE CUT OFF AT TOP, BOTTOM OR SIDES
□ FADED TEXT OR DRAWING
□ BLURRED OR ILLEGIBLE TEXT OR DRAWING
□ SKEWED/SLANTED IMAGES
□ COLOR OR BLACK AND WHITE PHOTOGRAPHS
□ GRAY SCALE DOCUMENTS
□ LINES OR MARKS ON ORIGINAL DOCUMENT
□ REFERENCE(S) OR EXHIBIT(S) SUBMITTED ARE POOR QUALITY

IMAGES ARE BEST AVAILABLE COPY.

OTHER:

As rescanning these documents will not correct the image problems checked, please do not report these problems to the IFW Image Problem Mailbox.
